

Advanced Two - Unit Two - Summary

It is almost our recurring daily problem, which could never satisfy the people with itself. It is called work! The main problem with the work has many roots. Below, you can find some of them: inducing stressful life, disturbing relationships, communications, etc.

According to a survey, 40% of British workers are satisfied with their job compared to other countries such as Germany, France, Italy, and Spain, which have provided lower qualities and opportunities for their labor force. The high percentage of England's satisfaction is due to recent systematic changes such as wage increase, sabbatical offers, and remote work ...

An undeniable fact is that we are still hating our jobs and waiting eagerly for the weekend, although some significant changes have been applied to this field by governments. A Russian politician declares that this distaste's main reason is that every worker has to obey some limited regulations, which is pleasant for nobody!

From another aspect, as Einstein said, "job is the only thing that could give existence to life," job could have many positive points. It could be an aim for all of us since it is not only a job environment but also social media to establish new friendships, dating with our partner, etc. Unfortunately, less than half of us are paying attention to this aspect!

There are some old arguments upon life/work balance. These debates are no longer valid since the work is becoming a vital part of our life. Some people love to overwork than regular working hours, but it is surprising that according to a survey, these people love their jobs crazily, no matter whatever it is. Mentioned people tend to be at work rather than at home, which is because of their attitude, not their obligations or chores!

Finally, we should take our job as the main part of our life which could not be separated. Zeltin, an Oxford don, believes that the distinction between our job and leisure time should be totally eradicated since it is oppositely leading us!
