

High Two – Unit Ten - Summary

Teaching theories can be organized into two categories: a teacher-centered approach versus a student-centered approach. Both of these teaching methods have pros and cons. In the following, we are going to compare these two teaching strategies with each other.

In teacher-centered education, students put all of their focus on the teacher. The teacher talks and the students exclusively listen. During activities, students work alone, and collaboration is discouraged. In this style, teaching and assessment are viewed as two separate entities; student learning is measured through objectively scored tests and examinations.

When a classroom is operated with student-centered instructions, instead of listening to the teacher exclusively, students and teachers interact equally. Group work is encouraged, and students learn to collaborate and communicate with one another. In these classes, students' learning is measured through formal and informal forms of assessment, like group projects, student portfolios, and class participation.

In recent years, more teachers have moved toward a student-centered approach. However, some students maintain that teacher-centered education is more effective. In most cases, teachers should use a combination of techniques to ensure that all student needs are met.
