

The causes of air pollution in big cities ...

Air pollution is a significant problem facing our environment today since it is threatening human life, especially in big cities. Many different chemical substances contribute to air pollution. To stop this disaster, we have to know its primary resources. In urban areas, two main sources that air pollution has been known to evolve from are harmful emissions from industrial factories and soot from fossil fuels' burning.

Sources of pollution have increased steadily since the Industrial Revolution due to consumer demand and reliance on conventional energy resources such as coal and oil. As a solution to this problem, motivating people to use public transport and conserving energy could be a good start.
